Education

Bilkent University — Ankara, Turkey
B.S. in Computer Engineering (English-medium instruction) — *Sep. 2024 – Jun. 2028 (expected)*

Research Experience

Digital Brain Technologies — Aug. 2026 – Present
LLM Research Group — *Remote*

- Review newly released language models and agent research each week, and present assessments of how they could fit the company's AI agent platform.
- Write reports on model hosting options, inference cost and agent reliability, each ending with recommendations for the platform team.

SINTEF Digital — Jun. 2026 – Sep. 2026
Research Intern, supervised by Dr. Arda Göknil — *Norway (Remote)*

- Designed a controlled study crossing three agent architectures with three levels of automatic prompt optimization, holding task, model and round count fixed.
- Replicated VulTrial (arXiv:2505.10961, ICSE 2026) on its own benchmark with different models substituted in, and reproduced its model-specific failure patterns in two independent runs weeks apart.
- Ran the full detector-critic sweep (nine model pairings) at two feedback depths, and traced several early accuracy differences to bugs in the evaluation code rather than to model behaviour.
- Reviewed 25 papers on prompt optimization and multi-agent design, and wrote a handover report for the project's next phase.

Bilkent University, Dept. of Computer Engineering — Jan. 2026 – Present
Undergraduate Researcher with Asst. Prof. Anıl Koyuncu — *Ankara, Turkey*

- Sole student on a systematic literature survey of computer vision applications in software engineering, extending Bajammal et al. (IEEE TSE 2022). Manuscript in preparation for journal submission.
- Read and classified all 199 candidate papers in the search results against the survey's inclusion criteria, and wrote the full draft of the paper.

Industry Experience

Akdoğan Tech — Aug. 2026 – Sep. 2026
Engineering Intern, defense and unmanned systems company — *Cyberpark, Ankara*

- Built a Webots and ArduPilot simulation pipeline for an unmanned surface vehicle over MAVLink, then integrated it with QGroundControl and ROS 2 for control and telemetry.
- Replaced a custom obstacle-avoidance script with ArduPilot's native avoidance system, so the vehicle could be operated from any standard ground control software.

Projects

Autonomous Surface Vehicle | *Teknofest 2026 USV Competition* | repo — Jan. 2026 – Jun. 2026

- Formed and captained a 5-person team drawn from computer, electrical-electronics and mechanical engineering, running task coordination and sponsor outreach.
- Specified the vision and control software architecture in the design reports, covering HSV-based buoy detection and a mission state machine across a four-layer ROS 2 node structure (Raspberry Pi 4, GPS/IMU, LoRa/MAVLink telemetry, PID heading control).
- Authored the software sections of the technical feasibility and critical design reports. The team cleared the Technical Qualification Report stage and was eliminated at the Critical Design Report stage.

Skills

Programming: Python, Java, C++
Tools: Git, Docker, ROS 2, Webots, ArduPilot, MAVLink, QGroundControl, DSPy, OpenCV
Languages: Turkish (native), English (B12/C1), German (A2)

Activities

Bilkent Artificial Intelligence Society | *Board Member* — Sep. 2026 – Present
Gazete Bilkent (university newspaper) | *Culture & Arts Editor, previously writer* — Nov. 2025 – Present
IEEE Bilkent Student Branch, Mercek Magazine | *Author and Editor* — Oct. 2025 – Jan. 2026
