nevadincer.github.io | Ankara, Turkey

Research interests	Computer vision, computer vision for software engineering, LLM agents and their evaluation	
Education	Bilkent University	Ankara, Turkey
	B.S. in Computer Engineering (English-medium instruction)	Sep. 2024 – Jun. 2028 (expected)
Research experience	SINTEF Digital	Jun. 2026 – Sep. 2026
	Research Intern, supervised by Dr. Arda Göknil	Norway (Remote)
	- Designed a controlled study crossing three agent architectures with three levels of automatic prompt optimization, holding task, model and round count fixed. - Replicated VulTrial (arXiv:2505.10961, ICSE 2026) on its own benchmark with different models substituted in, and reproduced its model-specific failure patterns in two independent runs weeks apart. - Ran the full nine-pair detector-critic model sweep at two feedback depths, and traced several early accuracy differences to bugs in the evaluation code rather than to model behaviour. - Reviewed 25 papers on prompt optimization and multi-agent design, and wrote the project's internal technical report separating findings backed by saved artifacts from those that were not.	
	Bilkent University, Dept. of Computer Engineering	Jan. 2026 – Present
	Undergraduate Researcher with Asst. Prof. Anil Koyuncu repo	Ankara, Turkey
	- Preparing a workshop paper as the sole student on a systematic literature survey of computer vision applications in software engineering, extending Bajammal et al. (IEEE TSE 2022). - Read and classified all 199 candidate papers in the search results against the survey's inclusion criteria, and wrote the full draft of the paper.	
Industry experience	Akdoğan Tech	Aug. 2026 – Sep. 2026
	Engineering Intern	Cyberpark, Ankara
	<i>Defense and unmanned systems company</i>	
	- Built a Webots and ArduPilot simulation pipeline for an unmanned surface vehicle over MAVLink, then integrated it with QGroundControl and ROS 2 for control and telemetry. - Replaced a custom obstacle-avoidance script with ArduPilot's native avoidance system, so the vehicle could be operated from any standard ground control software.	
Projects	Autonomous Surface Vehicle <i>Teknofest 2026 USV Competition</i> repo	Jan. 2026 – Jun. 2026
	<i>National autonomous marine vehicle competition, part of Turkey's largest technology festival</i>	
	- Formed and captained a 5-person team drawn from computer, electrical-electronics and mechanical engineering, running task coordination and sponsor outreach. - Specified the vision and control software architecture in the design reports, covering HSV-based buoy detection and a mission state machine across a four-layer ROS 2 node structure (Raspberry Pi 4, GPS/IMU, LoRa/MAVLink telemetry, PID heading control). - Authored the software sections of the technical feasibility and critical design reports; the team cleared the Technical Qualification Report stage and was eliminated at the Critical Design Report stage.	
Skills	Programming: Python, Java, C++	
	Tools: Git, Docker, ROS 2, Webots, ArduPilot, MAVLink, QGroundControl, DSPy, OpenCV	
	Languages: Turkish (Native), English (C1/C2), German (A2)	
Extracurricular	Gazete Bilkent (university newspaper), Culture & Arts Editor (previously writer)	Nov. 2025 – Present
	Bilkent Artificial Intelligence Society , Board Member	Sep. 2026 – Present
